

Radians

The radian (rad) is a unit of angle measure.

When a wheel completes a turn...

- 1) how many degrees has it moved? 360°
- 2) how far has the rim of the wheel travelled? $C = 2\pi r$
- 3) How many times is the radius contained in the circumference? 2π times

When the distance covered on the circumference is equal to the length of the radius (i.e., $\widehat{AB} = r$), the measure of the central angle is equal to 1 radian.

- There are 2π radians in a circle.
- $360^\circ = 2\pi$ radians

$$180^\circ = \underline{\pi} \text{ rad}$$

$$90^\circ = \underline{\frac{\pi}{2}} \text{ rad}$$

$$135^\circ = \underline{\frac{3\pi}{4}} \text{ rad}$$

We can convert between radians and degrees using the proportion

$$\frac{n^\circ}{360^\circ} = \frac{\theta \text{ rad}}{2\pi} \text{ or}$$

$$\frac{n^\circ}{180^\circ} = \frac{\theta \text{ rad}}{\pi}$$

Example: What is

a) 50° in radians? $\frac{50^\circ}{180^\circ} = \frac{x}{\pi} = \frac{50\pi}{180} = 180x$

$$0.8727 = \frac{5\pi}{18} = x$$

b) 2.3 rad in degrees? $\frac{y}{180^\circ} = \frac{2.3}{\pi} = 131.78^\circ$

c) 12π rad in degrees? $6 \times 360 = 2160^\circ$

d) 120° in radians?
