

Function Parameters

- Every "family" has a **basic** or **parent** function - the simplest form of that function.

$$\text{Eg: } y = x$$

- We can transform a function by changing certain values called **parameters**.

- We consider four parameters: a , b , h & k .

$\underbrace{a, b, h}_{\text{multiply}}$ & $\underbrace{k}_{\text{add}}$

In a basic function,

$$a = 1$$

$$b = 1$$

$$h = 0$$

$$k = 0$$

Parameter h

basic $y = x^2$ ($h = 0$)

$$y = (x - 2)^2 \quad (h = 2)$$

$$y = x^2$$

$$y = (x + 2)^2 \quad (h = -2)$$

Parameter h

Summary:

Parameter h causes a translation or shift of the function to the left or to the right h units.

$h > 0$ shift to the right

$h < 0$ shift to the left

The rule or equation is written $(x - h)$.

Parameter k

$$y = x^2 \quad (k = 0)$$

$$y = x^2 + 20 \quad (k = 20)$$

$$y = x^2 \quad (k = 0)$$

$$y = x^2 - 20 \quad (k = -20)$$

Parameter k

Summary:

Parameter k causes a translation or shift of the function up or down k units.

$k > 0$ shift up

$k < 0$ shift down

Parameter a

In a basic function $a = 1$.

$$y = \cos x$$

$$y = 2 \cos x \quad (a = 2)$$

$$y = \cos x$$

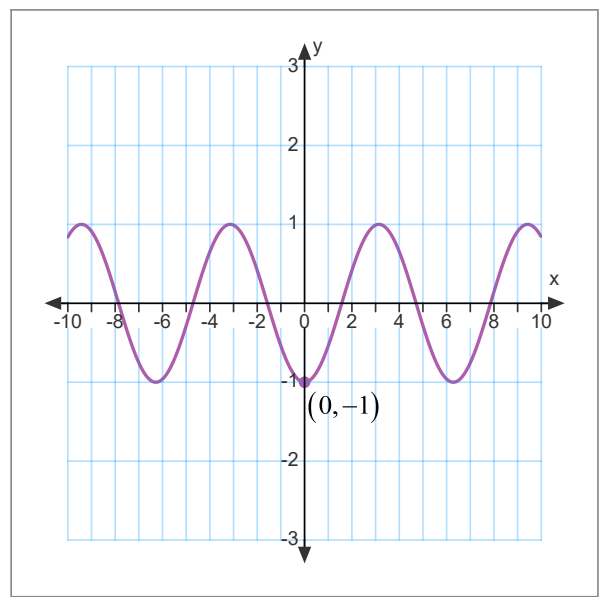

$$y = \frac{1}{2} \cos x \quad \left(a = \frac{1}{2} \right)$$

$$y = \cos x$$

$$y = -\cos x$$

$$y = \cos x$$

$$y = -2 \cos x$$

Parameter a (basic function $a = 1$.)

Parameter a affects a function's relationship with the x -axis.

not looking at sign looking @ size \Rightarrow 2 or -2 mean the same thing

$|a| > 1$ the function moves away from the x -axis. (vertical stretch)

0.5 or -0.5 $|a| < 1$ the function moves towards the x -axis. (vertical compression)

$a < 0$ the function is reflected about the x -axis.

Parameter b (basic function $b = 1$)

$$y = \sin x$$

$$y = \sin(2x) \quad (b = 2)$$

$$y = \sin x$$

$$y = \sin\left(\frac{1}{2}x\right)$$

$$y = \sqrt{x}$$

$$y = \sqrt{-x}$$

Parameter b (basic function: $b = 1$)

Parameter b affects a function's relationship with the y -axis.

$+3 ; -3$

$|b| > 1$ the function moves towards the y -axis
(horizontal compression).

$\frac{1}{3}$
or $-\frac{1}{3}$ $|b| < 1$ the function moves away from the y -axis
(horizontal stretch).

$b < 0$ the function is reflected about the y -axis.

Example of a function

Basic

$$y = \sqrt{x}$$

$$a = 1$$

$$b = 1$$

$$h = 0$$

$$k = 0$$

Transformed (with parameters)

$$y = 2\sqrt{-4(x-6)} - 8$$

$$a = 2$$

$$b = -4$$

$$h = 6$$

$$k = -8$$
